

Test Case Sprint 2: Use Case 1

Group members	Eric Keeton
	Aqib Akhtar
	Wilber Castillo
	Zach Sugarman
	Jorge Castillo Guerra
	Darell Limtsen

Test Case ID	TC_1
Test Scenario	First-time user loads MediCode; application automatically initializes disclaimerAccepted in localStorage with a default value of false and displays the disclaimer.
Preconditions	1. Browser localStorage is empty OR contains no disclaimerAccepted key. 2. The user has never accessed MediCode on this browser profile.
Test Steps	1. Open MediCode in a fresh browser session (new browser, incognito, or cleared localStorage). 2. Observe that the disclaimer screen appears immediately. 3. Open DevTools → Application → Local Storage. 4. Verify that the application has created the key disclaimerAccepted with value "false".
Expected Result	1. The disclaimer screen is shown to the user. 2. The application creates a new localStorage entry: disclaimerAccepted = "false" 3. No access to the main application is permitted.
Postconditions	1. localStorage contains disclaimerAccepted = "false". 2. User remains on the disclaimer screen until an action (Accept/Decline) is taken.

Test Case ID	TC_2
Test Scenario	The user declines the disclaimer and cannot access the application; localStorage remains false.
Preconditions	1. localStorage: disclaimerAccepted = "false". 2. The disclaimer screen is visible.
Test Steps	1. Click the “Decline” button on the disclaimer. 2. Observe the resulting page (decline/info page). 3. Open DevTools and verify disclaimerAccepted in localStorage. 4. Reload the page. 5. Observe which screen is shown and check localStorage again.
Expected Result	1. The user is taken to a decline/info page explaining they cannot use the app. 2. disclaimerAccepted in localStorage remains "false". 3. On reload, the user still does not get access to the main application (they see disclaimer/decline flow only).
Postconditions	1. localStorage: disclaimerAccepted = "false". 2. The user is blocked from accessing the main application UI.

Test Case ID	TC_3
Test Scenario	User accepts the disclaimer and gains access; returning to the app skips the disclaimer using localStorage = true.
Preconditions	1. The user is on the disclaimer screen. 2. localStorage: disclaimerAccepted = "false".
Test Steps	1. Click the “Accept” button on the disclaimer. 2. Observe navigation to the main MediCode application view. 3. Open DevTools and verify disclaimerAccepted in localStorage. 4. Reload the page. 5. Observe whether the disclaimer appears again or the app opens directly.

Expected Result	1. User is redirected from the disclaimer to the main application UI. 2. localStorage is updated: disclaimerAccepted = "true". 3. After reload, the app skips the disclaimer and loads the main application directly, using the stored true value.
Postconditions	1. localStorage: disclaimerAccepted = "true". 2. The user has full access to the application on subsequent visits.

Test Case ID	TC_4
Test Scenario	Clearing localStorage/Using Another Computer resets disclaimer behavior to first-time state.
Preconditions	1. localStorage: disclaimerAccepted = "true" (user has previously accepted). 2. The user can currently access the main app without seeing the disclaimer.
Test Steps	1. Open DevTools → Application → Local Storage. 2. Delete the disclaimerAccepted key (or clear all localStorage for the site). 3. (Optional) Reload the MediCode application. 4. Inspect localStorage.
Expected Result	1. Inspect console for: [disclaimer] STORAGE_KEY missing mid-session → re-locking app 2. On reload, the disclaimer is shown again as if this is the user's first visit. 3. On clearing localStorage the app automatically returns to disclaimer and sets app to locked state 4. localStorage sets/returns disclaimerAccepted to "false" (or creates it as false). 5. The user is blocked from the main app until they accept the disclaimer again.
Postconditions	1. localStorage: disclaimerAccepted = "false" (fresh state). 2. Application returns to first-time-user behavior.
